

Task: Make the Existing Website Fully Responsive

You are working on an existing production-ready frontend project.

Objective

Make the entire website fully responsive across all devices without changing the current design language, branding, functionality, animations, or technology stack.

Strict Requirements

DO NOT CHANGE

- Tech stack
- Project structure
- Folder structure
- Routing
- State management
- Business logic
- API calls
- Components unless required for responsiveness
- Colors
- Typography
- Icons
- Images
- Animations
- Hover effects
- Existing functionality
- SEO implementation
- Accessibility implementation
- Theme
- Spacing consistency (except where necessary for responsiveness)

The website should look identical to the current desktop version while adapting properly to different screen sizes.

Responsiveness Requirements

Make every page responsive for:

- Mobile (320px–480px)
- Large Mobile (481px–767px)
- Tablet (768px–1023px)
- Laptop (1024px–1439px)
- Desktop (1440px+)

What to Fix

Layout

- Fix overflowing content
- Remove horizontal scrolling
- Ensure every section fits within the viewport
- Convert fixed-width layouts to responsive layouts
- Use Flexbox/Grid appropriately
- Prevent layout breaking

Navigation

- Mobile hamburger menu
- Proper mobile navigation
- Close menu on navigation
- Sticky navigation should continue working
- Prevent body scroll when mobile menu is open

Typography

- Responsive font sizes
- Proper line-height
- Maintain readability
- Avoid text overflow

Images

- Responsive images
- Preserve aspect ratios
- No stretched images
- No cropped important content

Buttons

- Maintain touch-friendly sizes
- Prevent overflow
- Keep alignment consistent

Cards

- Stack cards appropriately
- Maintain equal spacing
- Preserve card design

Forms

- Responsive input fields
- Responsive labels
- Buttons should resize appropriately
- No clipping

Tables (if any)

- Make responsive
- Allow horizontal scrolling only when absolutely necessary

Sections

Every section should:

- Keep existing design
- Maintain spacing proportions
- Never overlap
- Never overflow
- Align properly on all screen sizes

Footer

- Responsive layout
- Proper alignment
- No overlapping elements

Responsive Implementation Guidelines

Prefer using:

- Relative units
- rem
- em
- %
- vw
- vh

Avoid:

- Fixed widths wherever possible
- Fixed heights unless absolutely required

Use existing styling methodology already present in the project.

If the project uses:

- Tailwind → Continue using Tailwind only.
- CSS Modules → Continue using CSS Modules only.
- SCSS → Continue using SCSS only.
- Styled Components → Continue using Styled Components only.

Do not introduce any new CSS framework or styling library.

Breakpoints

Implement responsive behavior using the project's existing breakpoint system. If none exists, use:

- 320px
 - 480px
 - 768px
 - 1024px
 - 1280px
 - 1440px
-

Performance Requirements

Do not:

- Increase bundle size unnecessarily
- Add new dependencies
- Install UI libraries
- Install CSS frameworks
- Duplicate components

Reuse existing components wherever possible.

Code Quality

Maintain:

- Existing coding style
- Existing naming conventions
- Existing folder structure
- Existing imports
- Existing architecture

Refactor only where necessary to achieve responsiveness.

Testing Checklist

Verify every page on:

- 320px
- 375px
- 390px
- 414px
- 768px
- 820px
- 1024px

- 1280px
- 1440px
- 1920px

Ensure:

- No horizontal scrolling
 - No clipped content
 - No overlapping elements
 - No broken layouts
 - No console errors
 - No visual regressions
 - All buttons remain clickable
 - All forms continue working
 - All animations still function
 - All pages remain pixel-perfect relative to the current desktop design
-

Deliverables

For every file modified:

1. Explain why it was changed.
2. Keep changes as minimal as possible.
3. Do not rewrite working code unnecessarily.
4. Preserve existing functionality exactly.

The final result should be the same website, with the same UI and behavior, but fully responsive across all modern devices and browsers.
